**On the Cover:** Example of evoked potential and streamline analysis for a single stimulation volume. Two treatment-resistant depression patients underwent neurosurgical treatment involving DBS. We compare tractography from pre-surgical MRI to post-surgical in vivo recordings. (A) Given the stimulation volume of interest as Right SCC monopolar stacked segmented contacts 4 and 7, (red sphere) the diffusion tractography to the whole brain is performed and intersection with the sEEG contact of interest (Left OFC contact 3) is calculated. (B) 315 single-pulse stimulation trials are applied to the Right SCC monopolar contacts 4 and 7, and evoked potentials are measured at the same sEEG contact as measured via streamlines in Panel A.
